

Name: _____
Student Number: _____

UNIVERSITY OF TORONTO
FACULTY OF APPLIED SCIENCE AND ENGINEERING

FINAL EXAMINATION, APRIL 2001

Third Year

CIV321H1S - GEOMECHANICS

Exam Type: A

Examiner - K. Klein

Permissible Aids
non-programmable calculator
compass
protractor
ruler

| Question | Mark |
|--------------|------------|
| 1 | /10 |
| 2 | /10 |
| 3 | /10 |
| 4 | /10 |
| 5 | /10 |
| TOTAL | /50 |

Name: _____
Student Number: _____

1. Short Answer Section

- a) What were the most significant results of the direct shear test? (3 marks)
- b) In the compaction test, explain what happens to the maximum dry density when the energy of compaction increases. Why? (3 marks)
- c) We have studied two second order partial differential equations in this course. What are their "names" and why do we use them? (2 marks)
- d) What factors affect the coefficient of permeability of a soil? (1 marks)
- e) What is critical state? (1 mark)

Name: _____

Student Number: _____

2. Test results shown in Figures 1 and 2 are representative of the compressibility of a 10 m layer of San Francisco Bay Mud (double drainage). The initial void ratio is 2.55.

- a) Determine C_c , C_r , and p'_c .
- b) What is the ultimate/final consolidation settlement of a large fill on the site if the average total stress increase on the clay layer is 20 kPa?
- c) How long will it take the clay to reach 80% consolidation?

$$T = \frac{c_v t}{(H_{dr})^2} \quad c_v = \frac{0.196 \bar{H}_{dr}^2}{t_{50}}$$

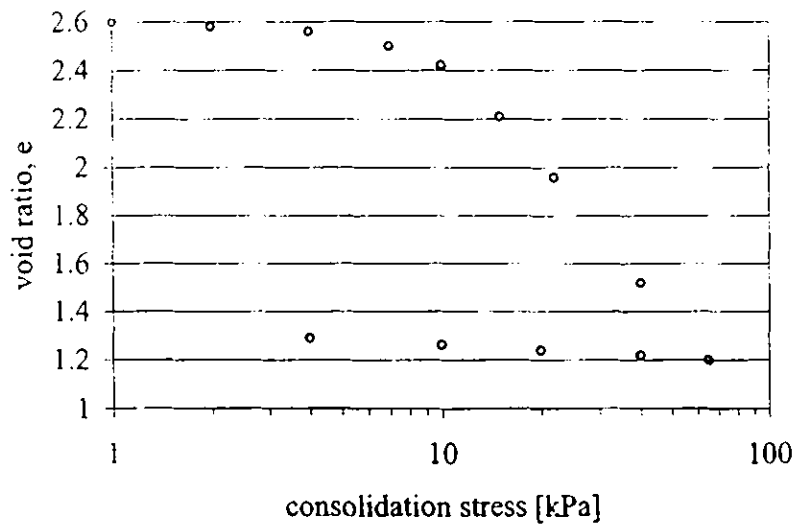

Figure 1 - Consolidation data For San Francisco Bay Mud.

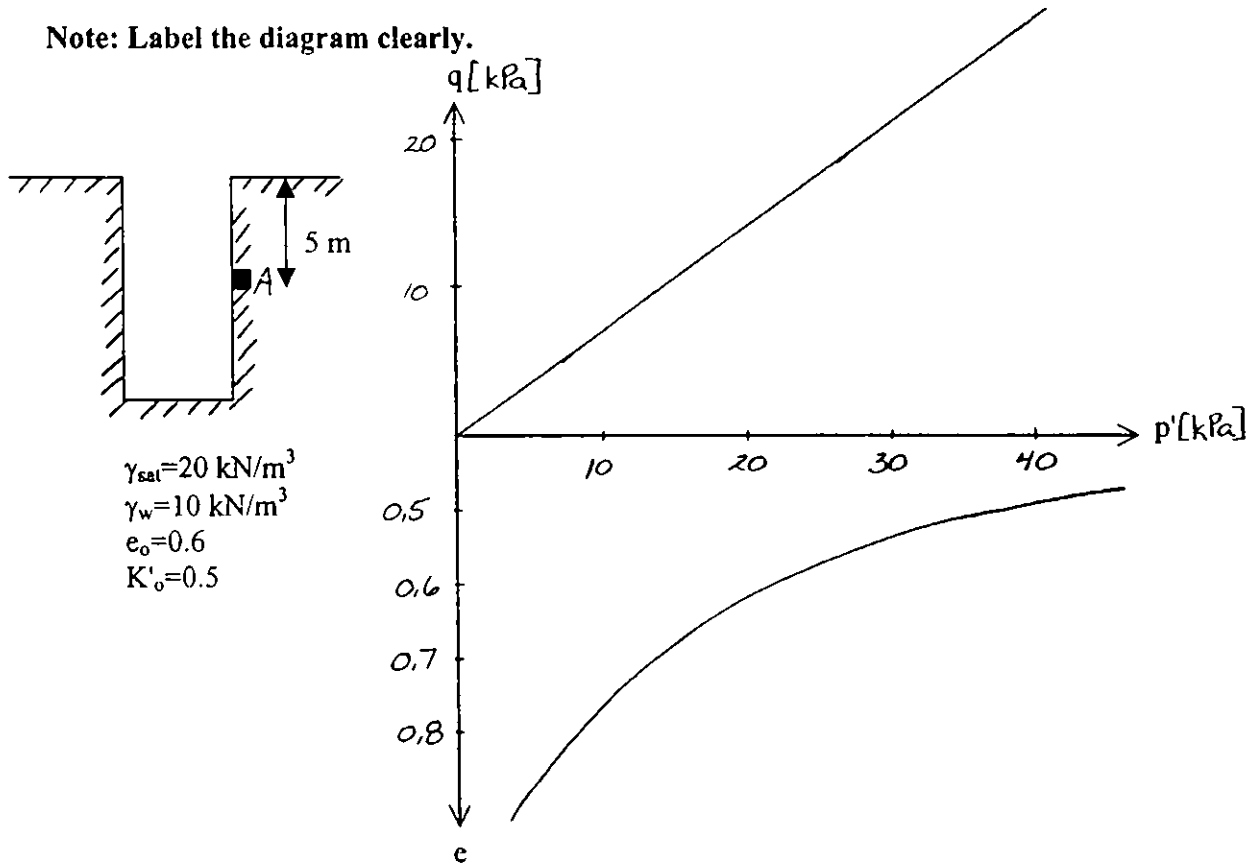

Figure 2 - Log-time plot For San Francisco Bay Mud (double drainage).

Name: _____
Student Number: _____

3. For the excavation shown below, answer the following questions:

- What are the initial (before excavation) vertical and horizontal effective stresses at point A (5 m below ground level)?
- If the excavation is performed very slowly (drained case), what is the void ratio at which the soil fails?
- If the excavation is performed very fast (undrained case), what is the excess pore pressure at failure?
- Is the soil contractive or dilative?

Note: Label the diagram clearly.

Name: _____
Student Number: _____

4. A steel storage tank 20 m in diameter will be used to hold a liquid petroleum product. When filled, the tank causes a pressure of 150 kPa. Assume that the stress induced by the empty tank is negligible. The water table is 2 m below the ground surface. For a depth 10 m below the base of the tank, compute the effective vertical and horizontal stresses when the tank is empty and when full, for a point beneath the centre of the tank.

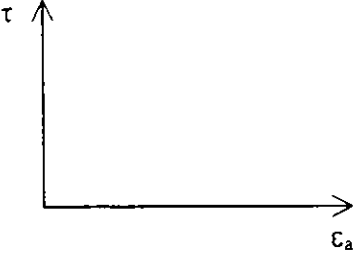

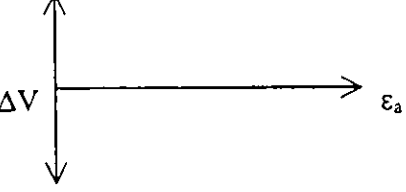

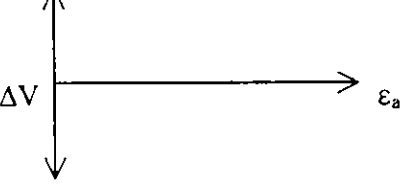

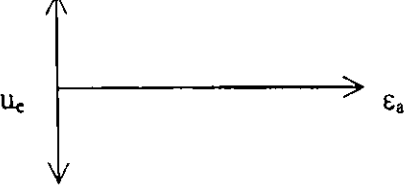

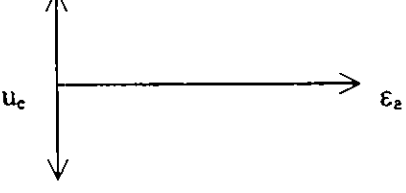

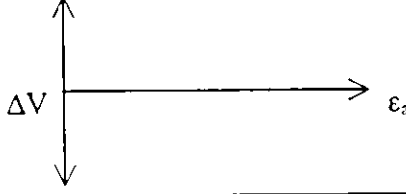

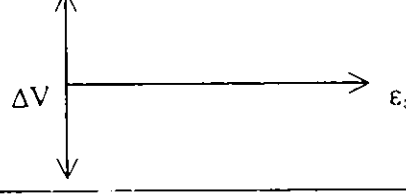

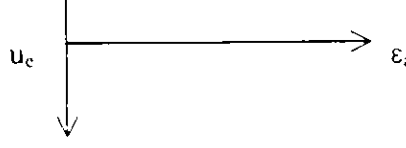

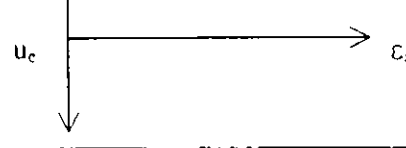

In order to support this load, what is the minimum friction angle that the soil could have?

Note: $\gamma_{\text{dry}}=18.5 \text{ kN/m}^3$, $\gamma_{\text{sat}}=20 \text{ kN/m}^3$, $\gamma_w=10 \text{ kN/m}^3$, $K'_o=0.6$, and $A=0.65$.

$$\Delta u = B[\Delta\sigma_3 + A(\Delta\sigma_1 - \Delta\sigma_3)]$$

Name: _____
 Student Number: _____

5. Complete the following table. Be neat and precise. Label important points.

| CONTRACTIVE | | DILATIVE | |
|---|--|----------|--|
| drained | | | |
|  |  | | |
|  |  | | |
|  |  | | |
|  |  | | |
| undrained | | | |
|  |  | | |
|  |  | | |

Fig. 8.5 Stresses under uniform load on circular area.
