UNIVERSITY OF TORONTO

Faculty of Arts and Science APRIL EXAMINATION - 2001

JSM282

Time -2-1/2 hours

SURNAME	
GIVEN NAME	
STUDENT NO.	
SIGNATURE	

- 1. One aid sheet, may be brought to the examination. Non-programmable calculators may be used. Tables are provided in the examination.
- 2. Read over the examination before beginning to answer questions. Allocate your time and energy on the basis of the points assigned to each question. The points are indicated on the left-hand margin of the sheets. Total points = 100.
- 3. Answer questions in the space provided. If you must use additional space indicate clearly where the marker is to find your answer. Show all work in order to guarantee maximum credit.

If the number of fish a person catches per hour at Rice Lake is a random variable having the Poisson distribution with λ = 1.8, find the probability that a person fishing there for an hour:
 (3 pts) (a) will not catch any fish at all;

(3 pts) (b) will catch at least four:

(3 pts) (c) will catch at most two.

9 pts) 2. In a "torture test" a light switch is turned on and off until it fails. If the probability that the switch will fail any time it is turned on or off is 0.001, what is the probability that the switch will fail after it has been turned on or off 1,200 times. Assuming that the conditions underlying the geometric distribution are met. (Hint: use the formula for the value of an infinite geometric progression.)

(10 pts) 3. Suppose that there is a fifty-fifty chance that Bob's ex-girlfriend will show up at a friend's birthday party to which he is planning to go. If she does not show up at the party, the odds are 3 to 1 that Bob will have a good time, but if she does show up, the odds are 4 to 1 that he will not have a good time. If someone tells us later that Bob had a good time, what is the probability that his ex-girlfriend did not show up?

4. Given the joint probability function of two random variables x and y, whose values are:

x/y	1	2	3
1	6/30	1/30	1/30
2	4/30	5/30	1/30
3	2/30	4/30	6/30

(3 pts) (a) Find the values of p(x), the marginal distribution of X.

(3 pts) (b) Find the values of p(y), the marginal distribution of Y.

(5 pts) (c) Find the values of p(x|2), the conditional distribution of X given that Y=2.

(5 pts) (d) Find the values of p(y|3), the conditional distribution of Y given that X=3.

(4 pts) 4(e) Find E(X + Y).

(3 pts) 4(f) Check whether the two random variables are independent.

(4 pts) 4(g) Calculate var (X + Y)

Page 6 of 10

6 pts) 5.(a) In order to test the durability of a new paint, a highway department has tested strips painted across heavily traveled roads in 8 different locations. If, on the average, the test strips disappeared after they had been crossed by 168,479 cars and the standard deviation is 12,851 cars, construct a 99% confidence interval for the number of cars it will actually take on the average to wear off this paint.

- - (7 pts) (b) The lifetime in hours of electronic tubes is a random variable having a probability density function

$$f(x) = \alpha^2 x e^{-\alpha x} , \qquad x \ge 0 .$$

(i) Find the moment generating function of a random variable X having f as a p.d.f.

(5 pts) (ii) Compute the expected lifetime of such a tube.

Page 8 of 10

- 6. A mass-produced plastic washer is being manufactured under acceptable statistical control, the mean of the thickness of the washers in the population should be .125 cm, and the standard deviation should be .005 cm. A theoretical control chart is set up to check on whether the washer thickness is actually under statistical control works as follows: A sample of five washers is taken at random every hour and the total thickness T of the five is measured and recorded on the control chart.
- (7 pts) (a) Determine the LCL, CL, and UCL for a 3-sigma theoretical control chart for the total thickness of five washers.

(4 pts) (b) If the process shifts so as to produce washers having mean thickness of .127 cm, what is the probability that the first sample taken after the shift occurred will produce a value of T above the UCL of the control chart?

 \supset

(4 pts) (c) What is the probability that at least one of the first two samples taken after the shift occurred will produce a T above the UCL?

(12 pts) 7. An auto rental firm is using 15 identical motors that are adjusted to run at a fixed speed to test 3 different brands of gasoline. Each brand is assigned to exactly 5 of the motors. Each motor runs on 10 gallons of gasoline until it is out of fuel. The following represents the total mileages obtained by the different motors.

Gas 1 : 220 251 226 246 260 Gas 2 : 244 235 232 242 225 Gas 3 : 252 272 250 238 256

Test the hypothesis that the average mileage obtained is not affected by the type of gas used. Use the 5% level of significance.
